

INTRODUCING OUR MOLECULAR PANEL FOR **CANINE RESPIRATORY DISEASES**

From one specimen, this panel detects:

- **Bordetella.**
- **Adenovirus type 2.**
- **Distemper.**
- **Herpesvirus 1.**
- **Influenza.**
- **Parainfluenza.**
- **Respiratory coronavirus.**

We use a real-time or quantitative polymerase chain reaction (qPCR) technique with an enhanced sensitivity that helps assure we can detect genetic material from agents that may cause these diseases.

- **Specimen:** A dry swab of the trachea or the pharynx.
- **Cost:** At \$80 for Texas clients, running the panel costs far less than ordering the individual tests.
- **Turnaround time:** 3 business days from the time the specimen arrives at our lab.

This panel is available only at our College Station lab. To order, please write "Canine Infectious Respiratory Disease Panel" on your submission form.
